State Chart Diagram

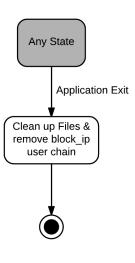

Log Monitor Daemon

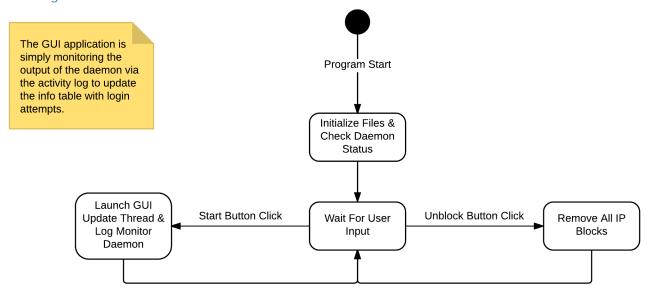

This thread loops forever, keeping track of the time while monitoring changes in the JsonDocument that has information about login attempts.

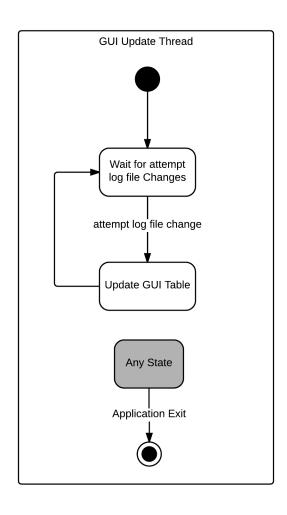

If enough time has elapsed, the the IP's attempt counter will be reset, or the IP will be unblocked, depending on it's status.

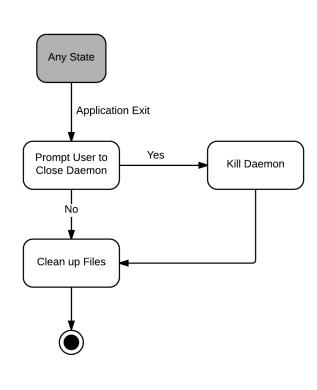

State Chart Diagram - continued

GUI Design

Pseudo Code

Log Monitor Daemon

```
Check for PID file
    if there is a process id file
        read the file for pid
        kill the pid
        close the file
    write current pid to file
    close the file
Initialize Running Parameters & Start IP Block Monitor Thread
    create settings file with running parameters
    if there is an activity log
        read the contents into JsonDocument
    create IP tables user chain for blocked IPs
    start IP Block Monitoring Thread
    go to Wait for Log File Changes
IP Block Monitoring Thread
    loop forever
        if the JsonDocument is empty
            sleep(1)
            continue
        get the current time
        for each ip in the JsonDocument
            if the status is "failed attempt"
                if the current time - the status time > attempt time reset
                    reset the attempt counter for this ip
                    update the status for this ip to "attempts reset"
            else if the status is "ip blocked"
                if the current time - the status time > block time
                    reset the attempt counter for this ip
                    update the status for this ip to "ip block expired"
                    unblock this ip in iptables
        sleep(1)
Wait for Log File Changes
    if the log file changes
        read the changed content
        if the changed content contains login attempts
            go to Update JsonDocument & attempt log file
Update JsonDocument & Attempt Log File
    update the activity log file
    update the JsonDocument
    if this ip has too many attempts
        block it in iptables
    go to Wait for Log File Changes
Any State
    if the user close the application
        remove settings file
        remove activity log file
        remove ip_block user chain in iptables
    exit
```

Initialize Files & Check Daemon Status

```
initialize the gui
if daemon settings file exists
   read settings file
   read activity log
   update gui table
go to Wait For User Input
```

Wait For User Input

```
if user click start button
    go to Launch GUI Update Thread & Log Monitor Daemon
if user clicks unblock button
    go to Remove All IP Blocks
```

Launch GUI Update Thread & Log Monitor Daemon

```
get user settings
if user specified log file doesn't exist
    notify user
    go to Wait For User Input
start GUI Update Thread
lock ui user settings
```

GUI Update Thread

```
loop forever
   if activity log file changed
     read acitivty log
     update info table with new info
```

Remove All IP Blocks

```
truncate activity log file // this remove history
remove ip_block user chain in iptables
```

Any State

```
if application exits
    if daemon is running
        ask user if they want to close it
clean up files
exit
```
